Submitted (23-JUL-1999) Genoscope - Centre National de Sequencage: Submitted (23-JUL-1999) Genoscope - Centre National de Sequencage: BP 191 91006 EVRY cedex - FRANCE (E-mail: seqref@genoscope.cns.fr)
Web: www.genoscope.cns.fr)
Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billand at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CNSO2AGC 1129 bp DNA linear GSS 12-MAY-200C Tetraodon nigroviridis genome survey sequence PUC-Ori end of clone 251LO9 of library G from Tetraodon nigroviridis, genomic survey

/note="Vector: pZero-2 (Invitrogen); Site_1: EcoRV;
Genomic DNA was isolated from stationary phase cells. For this library, DNA was sheared to give a tight size distribution of 1-1.5kb fragments, blunt-ended with T4 DNA polymerase, dephosphylated with Shrimp Alkaline
Phosphatase and ligated into pZero-2 vector's EcoRV site."

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - . This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre Project grant. The DNA was prepared from embryos by Alain Bucheton and Geneyieve Payan. It has been constructed in the vector

                                                                                                                                                                                                                                                                    ö
                                                           The present sequence is S. griseus SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycellum in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, herbicides, antiparasitic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.

The present sequence is S. netropsis SsgA protein. SsgA reduces branching and fragment septation and enhances fragmentation of mycel in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigraine agents, berbicides, antiparastic agents, ruminant growth promoters, bioinsecticides, receptor agonists and antagonists and biomass.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present sequence is S. goldeniensis SsgA protein. SsgA reduces branching and fragment septration and enhances fragmentation of mycelium in liquid culture resulting in lower viscosity of culture broths. Filamentous bacteria can be transformed with ssgA gene-containing plasmid to enhance the production of secondary metabolites such as, antibiotics, antitumour agents, immunosuppressive agents, hypocholesterolaemic agents, enzyme inhibitors, antimigranie agents, herbicides, antiparasitic agents,
                                                                                                                                                                                                                                                                                                                  VHIGPTEPEGLGDVHIRLQVGADRALFRAGTAPLVAFLDRTDKLVPLGQEHTLGDFDGNL 120

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-JUL-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21-JUL-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           22-JUL-1999
                                                                                                                                                                                    6
          diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG3037 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                        Gaps

carcinoma, bile duct, bladder or colorectal cancer. Crohn's disease, carcinoma, bile duct, bladder or colorectal cancer. Crohn's disease, colitis-associated neoplasia or chronic ulcerative colitis. These conditions, where associated with a homozygous deletion, can be treated by administering an agent that: (a) modulates DPC4 expression, specifically a sense DPC4 sequence (particularly in the form of a vector, i.e. by gene therapy), but also an antisense sequence where DPC4 protein is over expressed or (b) mimics the activity of DPC4 nucleic acid is also used as hybridisation probes for detecting nucleic acid is also used as hybridisation probes for detecting concleic acid is also used as hybridisation probes for detecting a homozygous deletion is detected in this region, an agent can be administered that accumulates within, or kills, only cells which contain such a deletion. This agent exploits the absence of an enzyme (or other protein) encoded by a neighbouring gene and lost by the

DPC4 is a tumour suppressor gene. Detection of truncated DPC4 protein, or of homozygous deletions or intragenic mutations in the encoding nucleic acid, is used to diagnose

                                                                                                                                                                                                                                                     6
                      using a chimeric Doc4 (Deleted in Pencratic Carcinoma, locus 4) polypeptide coupled to a nuclear localisation factor. Upon localisation to the nucleus and binding to Smad-binding element (SBE), Dpc4 shows tumour suppressor action. This method can also be used for identifying transforming growth factor-beta (TGF beta) inducible genes, modulators of Dpc4 nuclear localisation and in screening for anti-cancer drugs. Dpc4 can be used in the treatment of neoplasms and in gene therapy. The present sequence is that of human Dpc4 tumour suppressor protein. Note: It is indicated in the claims section that the present peptide sequence is sequence Id No: 1 and elsewhere in the specification as

                                                                                                       heterodimerisation partner for the pathway restricted members of the Smad family (Smadl-3, 5 and MADH6) and is known as the common mediator. The N-terminus of Smadd promotes the binding of the Smad complex to DNA, and the C-terminus provides an activation signal required for the complex to stimulate transcription. The invention relates to antisense oligonucleotides targetted to the human Smadd gene, which inhibit its expression. A series of oligonucleotides (AAZS9749-Z59788) were designed to target different regions of the human Smadd RNA, and were analysed for their effect on Smadd mRNA levels by quantitative real-time PCR. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with Smadd expression, such as tumour formation, inflammation and certain infections.
superfamily signal transduction. On ligand binding, TGF-beta superfamily
                       proteins (such as bone morphogenetic protein (BMP), activin and TGF-betas themselves) phosphorylate Smad proteins, which then homo- or heterodimerise and translocate to the nucleus to activate target gene transcription. Smad4 (also known as MADH4 and DPC4) is a shared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 5 VSEELSFRIPV------ELRYEVGDPYAIRMTFHLPGDAPVTWAFGRELLL 49

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  6
                                                                                                                                          The present sequence represents a human Smad4-green flourescent protein fusion product. The fusion protein is used in an assay that exemplifies the invention. The specification describes how quantitative information about the influence of a molecule on a claim intact into the influence of a molecule on a claim intact living cells, in the spatially distributed light emitted from a luminophore present in the cells. The variation in light emission is processed to provide information that correlates spatial distribution to the degree of the molecule. The method is used to identify agents that (in) directly affect intracellular signalling, especially to screen for potential therapeutic agents or toxins, and to identify new drug targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         304 vhnelafqppisnhpapeywcsiayfemdvqvge-----tfkvpsscpi-----vtv 350

                                            The present sequence represents a human Smad4-green flourescent that exemplifies the invention. The specification describes how quantitative information about the influence of a molecule on a cellular response is obtained by recording the variation, caused by the molecule, on mechanically intact living cells, in the spatially distributed light emitted from a luminophore present in the cells. The variation in light emission is processed to provide information that correlates spatial distribution to the degree of the molecule. The method is used to identify agents that (in)directly affect intracellular signalling, especially to screen for potential therapeutic agents or toxins, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Periplasmic chitodextrinase; periplasmic Beta-N-acetylglucosaminidase; Beta-N-acetylglucosamidase; chitin; oligosaccharide; catabolic;

Chitin is a homopolymer of beta 1-4 N-acetylglucosamine (GLONAc). Chitin degradation by V. furnissii involves several signal transducing systems and a multitude of proteins.
                                                                                                                                                                                                                                                                                                                                                            Chitodextrinase; periplasmic; endI; Endo-I; chitin; chitosan; endoenzyme;

       Periplasmic chitodextrinase (AAW02156), periplasmic Beta-N-acetylglucosaminidase (AAW02157) and aryl Beta-N-acetylglucosaminidase (AAW02158) can be used to produce chitin Oligosaccharides with the structure (GICNAc)n where n is 2 or higher, by contacting them with soluble chitin. The enzymes are encoded by the genes end!, exoI and exoII respectively. They are all genes involved in the catabolic pathway of chitin.

in contrast to other organisms, which only require two enzymes to degrade chitin to GLONAc. Endo-I is an endoenzyme, cleaving internal glycosidic bonds in soluble chitin-derived oligosaccharides to produce GLONAc dimers and/or trimers. Chitin oligosaccharides have been recently shown to be physiologically active and are useful in agriculture and medicine. Derivatised oligosaccharides are generated by Rhizoblum species as signals for the formation of nitrogen fixing nodules by leguminous plants and also induce disease resistance in certain plants. They also inhibit antimetastatic agent against Lewis lung carcinoma, and GloNAc polymers of varying lengths activate macrophages and the immune system. Prior art methods of production of such oligosaccharides are prohibitively methods of production of such oligosaccharides are prohibitively compounds. Use of recombinant V. furnissi chitin catabolic enzymes may help to reduce or eliminate these problems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ë

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (Synovitis, acne, constitutosis, hypertosis and osteomypaltis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central criving system, however it is particularly involved in the inflammatory consence or absence of P. acnes in a patient comprises contacting a presence or absence of P. acnes in a patient comprises contacting a comple with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The colypeptides may be used as antigons in the production of antibodies of specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and crivity of P. acnes polypeptides and diagnostic agents for determining P. acnes presence, for example, by contact in the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO XXX

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                           .....FDGNLEDALGRILAEEQNAG 135

A; Title: Identification of an abundant S-thiolated rat liver protein as carbonic anhy A; Reference number: $13896; MUD: 91112820
A; Accession: $13896
A; Status: preliminary
A; Molecule type: protein
A; Residues: 25, X', 27-34, 38, 'T', 40-42, 'XX', 45-46, 'S', 48-51, 'X', 53-56, 'RVV', 74, 'XXTFX'
C; Superfamily: carbonate dehydratase; carbonic anhydrase homology
C; Reywords: blocked amino end; carbon-oxygen lyase; hydro-lyase
F; 5-259/Domain: carbonic anhydrase homology <CAH>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 13

Jr.; "The binding of Cellulomonas fimi endoglucanase C (CenC) to cellulose and Sephadex is mediated by the N-terminal repeats.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              linkages in cellulose.
SIMILARITY: BELONGS TO CELLULASE FAMILY E (FAMILY 9 OF GLYCOSYL HYDROLASES).
SIMILARITY: CONTAINS 2 CELLULOSE-BINDING DOMAIN (CBD) REMOTELY RELATED TO BACTERIAL-TYPE CBD'S.
SIMILARITY: CONTAINS 2 IMMUNOGLOBULIN-LIKE DOMAINS.

-I- FUNCTION: DEGRADES SHORT-LIVED REGULATORY AND ABNORMAL PROTEINS IN PRESENCE OF ATP. HYDROLYZES TWO ATPS FOR EACH PEPTIDE BOND CLEAVED IN THE PROTEIN SUBSTRATE (BY SIMILARITY).

-I- CATALYTIC ACTIVITY: HYDROLYSIS Of large proteins such as globin, casein and denaturated serum albumin, in presence of ATP.

-I- SUBDINIT: HOMOTERRAMER (BY SIMILARITY).

-I- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-I- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI6; ALSO KNOWN AS THE LON FAMILY OF ATP-DEPENDENT PROTEASES.
